Attachment to Advisory Action (dated August 17, 2004)

On page 17 of Applicant's response, Applicant requests that Examiner point out specific sections of the reference that disclose the claim limitations. Applicant cites 37 CFR 1.104(c)(2), "When a reference is complex or shows or describes inventions other than that claimed by the applicant, the particular part relied on must be designated as nearly as practicable." The Examiner asserts that the Saito reference used in the art reference is neither complex nor does it describe inventions other than that claimed by the applicant; therefore, it is not necessary that the Examiner point out specific sections of the reference that disclose the claim limitations.

Applicant argues:

...each status describes a stage of processing in a work flow. For example, the status of a job may be ready, print. format, etc...Also, each work process that is associated with one status is an application program...Each job identified in the job status table comprises an entity on which work is performed under computer operation such as processing data, generating output materials, forwarding data to another location for further processing, printing, working on a material or device, etc...Thus, the job status table identifies the jobs to be processed by multiple work processes. On the other hand, the Saito patent uses multiple tables, rather than one job status table. The use of a gueue, a work management table, and a task definition table do not anticipate Applicants' claimed use of the job status table. Moreover, the claimed invention describes jobs processed by work processes (application programs), which is not anticipated by the Saito patent's description of tasks that are performed by individuals. (Page 29 of Applicant's response)

Saito teaches various examples of status tables, including the task definition table depicted in Fig. 2. The Infringement Countermeasure job comprises the tasks, or

Application/Control Number: 09/398,378

Art Unit: 3623

processes, listed in the task definition table (i.e., investigation, judgment, and countermeasures). The Input Document and Output Document columns define start and end statuses for each process. For example, the Investigation process commences with the input of an Infringement Report and terminates with the output of an Infringement Record. Once the Infringement Record is generated by the Investigation process, the Judgment process is triggered since its first status condition requires the input of the Infringement Record output by the Investigation process. Furthermore, the fact that "the claimed invention describes jobs processed by work processes (application programs)" (as asserted by the Applicant) does not preclude any human intervention with the work processes. Saito's invention utilizes a computer system to manage projects executed by humans (abstract). The computerized monitoring of the status of each task and process itself represents a work process that is an application program. Furthermore, monitoring of the status of a document requires that the document be electronically linked to the relevant tasks and processes, thereby indicating that the document itself is processed electronically at some stage, i.e., by an application program.

Applicant argues:

...First, the Saito patent describes notifying a user, which does not anticipate notifying a work process (application program). Second, the Saito patent describes a notification message with a link to a document, which does not anticipate notifying that a job had its status changed. (Page 20 of Applicant's response)

Application/Control Number: 09/398,378

Art Unit: 3623

Saito specifically states that the "workflow management unit performs transition and activation of a business phase included in a process definition, sets a work in work management table, and issues a task addition request" (abstract). Again, the various tasks are controlled at the level of the automated workflow management unit. Even if there is human intervention in performance of the tasks, there must be some level of electronic processing and notification since it is the automated workflow management unit that performs all status monitoring and notification.

As per claim 10, Applicant argues that "the description of links does not show teach [sic] that a data file is altered by one work process and transmitted to an output device by another work process" (page 21 of Applicant's response); however, Applicant provides no support for this assertion. As stated in the art rejection, the Examiner maintains that "figure 5 and column 7, lines 21-25 [of Saito] teach that a document is input in one format and is later used to output a document in another format, which exemplifies alteration of the format of a data file."

Regarding the limitations concerning what occurs when an error status is detected, the Applicant broadly traverses the rejection stating that "Applicants' are claiming a particular technique for error processing that is not taught or suggested by any prior art" (Page 22 of Applicant's response). Applicant provides no support for this assertion; therefore, Applicant's argument is not persuasive and the Examiner maintains her position regarding the limitations in question.

In conclusion, Applicant's arguments are not persuasive and the art rejections are maintained.
